RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 30 pages. Dimensions: 9.7in. x 7.4in. x 0.1in. This historic book may have numerous typos and missing text. Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1883 edition. Excerpt: . . . Therefore, Burts rule is: When running a parallel of latitude, if an object be observed due east or west, from any station, the correction of the course to touch the same parallel in the meridian of the object is equal to one-half of the angle of convergency between the two meridians, which pass through the station and the object. In practice this accounts for taking one-half the difference between fore and back sights, and setting it off toward the pole for sighting a true parallel line. Or, the angle to start a line of sights, on an east and west line, is equal to one-half the angle of convergency. The formula for ascertaining the convergency, applied to government work either for a township or check, becomes: Cos lot. of south boundary; cos lot. of north boundary: : length of south boundary: length of north boundary. P, North Pole. ADC, Sighting Chord. A and C, Stations. AEC, Parallel of Latitude. AB, Tangent. With A P and G P as meridians, the station C would be observed an angular amount North of West of A B, the apparent and A E the true parallel, from the station A depending upon the latitude of that station. When running Standard Parallels the correction offsets can be used from each corner on the sighted line southward to proper corners on the parallel, or the correction angle for six miles may be tude of the eoutli boundary being 85 North,...
